ECOPLAST P MINERAL

-5°C

THE PRODUCTS

ECOPLAST P in its different versions is an elastomeric membrane obtained from distilled bitumen modified with plastomeric polymers (APP).

ECOPLAST P is reinforced with a "non woven" polyester composite fabric, stabilized with a fibreglass mat.

Mineral versions differ only by having a surface finish of slate chips.

USES

ECOPLAST P 3 mm waterproofing membrane is suitable for under layer, intermediate layer in multi-layer systems or foundations.

ECOPLAST P 4 mm waterproofing membrane is suitable for use in applications on various roof types, whether they are insulated or not, especially those which are subject to high levels of stress such as tensile structures or metal profile decks.

ECOPLAST P MINERAL Waterproofing membrane and finish/top sheet for use in multi-layer applications on various roof types, whether they are insulated or not, especially those which are subject to high levels of stress such as tensile structure or metal profile decks.

FINISHES

Upper surface

ECOPLAST P membranes are embossed with a pattern of small squares and are available with a fine grain quartz finish, to ensure that the roll unrolls correctly.

ECOPLAST P MINERAL membranes are covered by natural grey slate chips. A 8 cm wide strip is left free from mineral chips to form the overlap joint. This area, as like the underside of the membrane, is protected by the application of polyethylene torch off heat sensitive film.

Lower surface

ECOPLAST membranes have a polyethylene torch off heat sensitive film which prevents the roll sticking together and ensures that the roll unrolls correctly.

This surface is again embossed with a pattern of small squares to help the polyethylene torch off film to melt quickly and allow gases to escape, it also acts as a temperature indicator to show that the compound has reached the correct fusion temperature.

PACKAGING

The top tape indicates the product type, and the lower tape the weight or thickness of the product. The rolls are supplied on wooden pallets and are held in position by a protective heat shrunk polythene covering. Each pallet has two control tickets which enable the laboratory to readily identify characteristics of the product.

TOOL REQUIREMENTS

For the correct installation of **ECOPLAST** type membranes, all that is required is a propane gas roofing torch complete with gas bottle reduction valve and least 10 m of approved type hose, a round nosed trowel or spatola, a utility knife, and a pair of gloves.

INSTALLATION

The surface where material is to be installed must be smooth, clean, dry and treated, if required, with primer. **ECOPLAST** membrane is unrolled and laid out on the dry primer coating, which will enhance the adhesion to the deck. It is then aligned before being rolled up again. The membrane is then slowly unrolled while the lower surface is heated using the propane gas roofing torch. Side laps must be at least 80 mm and end laps 150 mm.
